1869.

the things about which medical observation is exercised, and of forming a steady basis upon which medical experience may be safely built.

Another main use of the statistical registration of diseases on a wide scale, is that it must tend to throw light upon the causes of disease, many of which causes, when duly recognised, may be capable of prevention, removal, or diminution.

When a general and uniform Nomenclature of Disease has once been carefully framed, when we are sure that medical observation is occupying itself everywhere with the selfsame diseases, the value of statistical tables becomes very high, as representing the course of events in disease under various circumstances of time, place, season, climate, manners and customs, age, sex, race, and treatment.

This general, or common, or *standard* nomenclature need not be imposed upon every nation and people as its proper nomenclature. It could not. It would be unintelligible by the people at large, and embarrassing to those by whom the necessary returns must be made. But the nomenclature proper or peculiar to each country, and which may be called its *national* nomenclature, should be readily convertible into the *standard* nomenclature.

The one, or the other, of these standard and national nomenclatures may first be framed by an English (or by any other) Committee, or the two may be framed simultaneously.

The Committee appointed by the Royal College of Physicians of London have prepared a Nomenclature suitable to England, and to all countries where the English language is in common use. For each name they have supplied the corresponding Latin term, which is the language of ancient

science, and probably the fittest language for a nomenclature common to all the world; and also the equivalent term in the three modern languages which are the richest in medical learning and literature, the French, the German, and the Italian languages: and in this way they hope to have laid the foundation for a Nomenclature of Diseases in any language extant on the earth.

In the English list of names, it seemed desirable that as little deviation as possible should be made from those employed by the Registrar-General of England; otherwise his settled plans and his forms of returns, which have been followed for thirty years, would require to be remodelled; the comparison of future with past returns would be made difficult and perplexing, if not impossible; and a damaging break would be caused in evidence which becomes more and more trustworthy and valuable, in proportion as it is prolonged and continuous.

Again, it is desirable that all lists should consist, as much as may be possible, of short names—names comprised in one word, or in the fewest words; also, in the nomenclature proper, or national, that they should be names in common and popular use, especially when these are single, or short, and distinctive, and imply no erroneous or doubtful theories.

Names are not necessarily to be excluded, however, merely because they may seem to express only vague or imperfect knowledge; such names as Dropsy, Convulsions, Palsy—disorders which may severally depend upon various and different morbid changes within the body, not always easy of recognition. It has been well observed by Dr. Farr, whose aid has been of great value to the Committee, that the refusal to sanction such terms as these in the registration of diseases, 'would have an obvious

tendency to encourage reckless conjecture' in making returns.

Some names (as SMALL-POX) speak for themselves: many (as DIPHTHERIA) require to be defined, for the sole purpose, however, of identification: to others (as BRIGHT'S DISEASE) it is expedient, for the same purpose only, to append synonyms.

When fixed names have been given to diseases, their classification becomes a matter of some importance.

A good classification aids and simplifies the registration of diseases; helps towards a more easy comparison and knowledge of them, and towards the storing of experience respecting them; and facilitates the discovery of general principles from the collected, grouped, and compared phenomena.

But a good classification is a very difficult matter.

Diseases might be classified according to their symptoms; to their causes; to their intimate nature; to the tissues, or to the systems, of the body that are affected; or to the parts of the body as they lie anatomically.

After much consideration, the Committee have resolved 'that the proposed classification of diseases should be based upon anatomical considerations.'

In subservience to this anatomical distribution, diseases may also be grouped as being general or local.

General diseases are such as affect the whole frame rather than any special part of it. Local diseases are such as occupy special parts of the body.

General diseases may be conveniently subdivided into two sections, A and B.

Section A comprehends those disorders which appear to involve a morbid condition of the blood, and which

present for the most part, but not all of them, the following characters. They run a definite course, are attended with fever, and frequently with eruptions on the skin, are more or less readily communicable from person to person, and possess the singular and important property of generally protecting those who suffer them from a second attack. They are apt to occur epidemically. Of these epidemic visitations, Dr. Farr observes, that they distinguish one country from another, one year from another, have formed epochs in chronology, have decimated armies and disabled fleets, have influenced the fate of cities—nay, of empires.

Section B comprises, for the most part, disorders which are apt to invade different parts of the same body simultaneously or in succession. These are sometimes spoken of as constitutional diseases, and they often manifest a tendency to transmission by inheritance.

The construction of this Nomenclature has been so long in hand, that it may be proper and not uninteresting to record the circumstances of its origin and progress.

The idea which led to the formation of a general Nomenclature of Diseases originated in a correspondence between Dr. Dumbreck, of the Medical Department of the Army, and Dr. Sibson, respecting the need of such a Nomenclature for use in the Army Medical Service.

But at the *Comitia majora* of the Royal College of Physicians, held on the ninth day of July, 1857, it was resolved, on the motion of Dr. Nairne, in consequence of a letter addressed to the College by the Hospitals Committee of the Epidemiological Society, 'That a Committee be appointed to prepare a Nomenclature of Diseases, and

that such Committee have full power to co-operate with other bodies.'

The following Fellows of the College were appointed members of the Committee by the President of the College:—

INDEX 247

EXPLANATIONS.

Those diseases only have been defined which seemed to require it; and the definitions have been framed for the purpose of *identification* only, not as explanations of the phenomena of disease.

The words 'tending to' have always been applied to an event which is natural and probable, but not inevitable: 'resulting in' to an event which is inevitable, if the disease runs its natural course.

With a view to facilitate the registration of disease in accordance with this Nomenclature, the following Explanations are offered:—

By turning to the Alphabetical Index, the name of any disease may be readily found.

In the body of the work the name of each disease is preceded by a distinguishing number, and as a rule is printed in Roman letters, but in exceptional cases in *Italics*.

Whenever such exception is observed, the disease thus printed in *Italics* should not be registered among the local or other affections with which it appears, but under the class to which its special number refers it, and, as regards the organ in which it may be seated, in the order particularised at p. 15.

In short, the local manifestations of general diseases are to be returned, not among local, but among general diseases.*

* For example, in the list of diseases of the stomach given at p. 95, Cancer of that organ is included, but it is distinguished by *Italics*. And in making returns it should be placed among other cancerous affections, to which the prefixed number between brackets [44] refers it. If such return should include similar affections of other parts, the position assigned to disorders of the stomach, in relation to other organs, is determined by consulting the list given at p. 15.

Where varieties are observable in the forms of disease, such varieties are indicated by their being 'indented,' i.e. printed below and somewhat to the right of the principal heading, each being preceded by a distinguishing letter. Such lists are given by way of example, and are not to be regarded as exhaustive.

Diseases should only be returned under such general names as 'Dropsy,' 'Convulsions,' 'Palsy,' when the morbid conditions upon which they depend are unknown; but when the cause has been ascertained, the case should be registered under the head of the primary disease, the secondary affections being also specified.

Non-malignant Tumours and Cysts have not been numbered, for reasons stated at p. 19.

Surgical Operations, Parasites and Malformations are placed in an Appendix.

Notes in explanation of particular cases are given in various parts of the work.

Headache and analogous affections, being merely symptoms of constitutional or local diseases, are not included in this Nomenclature.

Arrangement of Local Diseases.

The attention of those making use of this Nomenclature is especially called to the 'Arrangement of Local Diseases' given at p. 29. That list, which occupies scarcely two pages, includes nearly all the important forms of disease which affect the various organs, and is therefore a key to the general arrangement of those diseases adopted throughout the work.

Latin Version.

In the Latin Version the translators have kept the following purposes steadily in view. They have endeavoured to avoid as far as possible all barbarous, ill-formed, and unnecessarily coined words; and they have taken for their standard the best writers of the Roman period, especially Celsus. To this must be ascribed the occasional deviations from the usages of modern Latin, and the discrepancies which here and there occur between the Latin version and the corresponding terms in the English Nomenclature.
